Wireless Sensor Network

- A **wireless sensor network** (WSN) is a wireless network consisting of spatially distributed autonomous devices using sensors to cooperatively monitor physical or environmental conditions, such as temperature, sound, vibration, pressure, motion or pollutants.

Motivation

◉ What?

- > To determine the physical coordinates of a group of sensor nodes in a wireless sensor network (WSN)
- > Due to application context and massive scale, use of GPS is unrealistic, therefore, sensors need to self-organize a coordinate system

◉ Why?

- > To report data that is geographically meaningful
- > Services such as routing rely on location information; geographic routing protocols; context-based routing protocols, location-aware services

RTLS - Definitions

- Anchor Nodes:
 - > Nodes that know their coordinates a priori
 - > By use of GPS or manual placement
 - > For 2D three and 3D four anchor nodes are needed
- Goal: to position a blind node by using pair-wise measurements with the anchor nodes.
 - > Anchor-based

RTLS - 2 phases

1. Determine the distances between blind nodes and anchor nodes.
2. Derive the position of each node from its anchor distances.

RTLS - Phase 1

- ◉ Range-less
 - > Connectivity
 - > Hop Count
 - Sum-Dist
 - Dv-Hop
 - Euclidean
- ◉ Range-based
 - > Ranging methods

RTLS - Phase 1 - Range-based

- ◉ TOA
- ◉ TDOA
- ◉ RTT
- ◉ AOA
- ◉ RSS

RTLS - Phase 1 - Range-based

- TOA
- TDOA
- RTT
- AOA
- RSS

Phase 1 – Range-based (RSS)

- ◉ Radio signals attenuate with distance
- ◉ Available in most radios
 - > No extra cost
- ◉ Poor accuracy
 - > Difficult to model

RSS - Errors

- ◉ Environmental errors
 - > Multipath
 - > Shading
 - > Interference
 - Gaussian noise

RSS - Errors

- Device errors
 - > Transmitter variability
 - > Receiver variability
 - > Antenna orientation

RSS - Model

- Different models
 - > log-distance path loss model
- $RSS(d) = P_T - P(d_0) - 10 n \log(d / d_0) + X_o$
 - > P_T Transmitted power [dBm]
 - > RSS Received Signal Strength [dBm]
 - > $P(d_0)$ Path loss in dBm at a distance of d_0
 - > n Path loss exponent
 - > d Distance between two nodes [m]
 - > $d(0)$ Reference distance [m]: 1m
 - > X_o Gaussian random variable

RTLS - Phase 2

- ◉ Range-based algorithms
 - > Trilateration
 - > MinMax
- ◉ Range-less algorithms
 - > CL
 - > WCL

Framework

- Product of the thematic ICT week:
 - > WSN Middleware
 - > Software framework:
 - WSN (Telos rev. B & Sun Spot)
 - Controller + database
 - GUI
 - > Distributed

Framework

- ◉ Data interface to the WSNs and GUIs
 - > XML
- ◉ Database
 - > Stored Procedures
- ◉ Localization algorithms
 - > Centralized

Framework - Technologies

- ◎ WSN
 - > TinyOS
 - > TelosB
 - > Xubuntos
- ◎ WSN XML Parser
 - > Java
- ◎ Controller, GUI
 - > C#
 - > .NET 3.5
- ◎ Interfaces
 - > XML over TCP
 - > WCF (http)

WSN - Telos rev. B

- TI MSP430 microcontroller with 10kB RAM
 - Ultra low-power
- IEEE 802.15.4 compliant radio
- Integrated temperature, light, humidity and voltage sensor
- Programmable via USB interface
- TinyOS 2.X compatible
- Integrated antenna

WSN - TinyOS

- ◉ Most popular OS for Wireless Sensor Networks
- ◉ Open source
- ◉ Energy efficient – low power
 - > Hurry up and go to sleep!
 - > Split phase commands
- ◉ Multi-platform

WSN - TinyOS

- Primary functions:

- > Sensing
- > Actuating
- > Communication
 - Collection
 - Dissemination

TinyOS - nesC

- TinyOS is completely programmed in nesC
 - > Interfaces
 - > Tasks
 - atomic
- nesC is a C dialect
- .nc
- Source code passes through a preprocessor
 - > C-code
- Gcc

TinyOS

- ◉ Still very experimental & academic
- ◉ Limited support
- ◉ No development environment
 - > No debugger
 - > Printf library

WSN

- Three different roles:
 - > Root Node
 - > Anchor Node
 - > Blind Node

WSN

- Three different messages:
 - > Sensor
 - > Location
 - > Status

WSN - Sensor message

- ◉ Battery (voltage)
- ◉ Light
- ◉ Humidity
- ◉ Temperature
- ◉ Button pressed
- ◉ Mote ID

WSN - Location message

- ◉ Mote id
- ◉ Anmoteid
- ◉ VANs
- ◉ VANr
- ◉ Hop count
- ◉ RSSI

WSN - Status message

- ◉ Mote id
- ◉ Active
- ◉ AN
- ◉ Posx
- ◉ Posy
- ◉ Samplerate
- ◉ locRate
- ◉ leds
- ◉ power
- ◉ frequency

WSN - Parser

The image shows a screenshot of a Windows application window titled "Parser". The window has a standard Windows XP-style title bar with a blue gradient, a minimize button, a maximize button, and a close button. The main content area is white and contains two sets of input fields and two buttons. The first set is labeled "Connection:" and "Port to listen to:" with input boxes containing "192.168.1.100" and "3800" respectively. The second set is labeled "Port to listen to:" with an input box containing "3801". At the bottom, there are two buttons: "Connect" and "Start".

GUI - Options

The image shows a screenshot of the 'WSN Monitor' application window, specifically the 'Options' tab. The window has a standard Windows-style title bar and a menu bar with 'Monitor', 'Graph', 'WSN Admin', 'Options' (selected), and 'About'. The main content area is divided into four panels: 'Controller', 'Polling rates', 'SensorFetch', and 'Control parameter bounds'. The 'Controller' panel contains fields for 'IP' (localhost) and 'Port' (1900), with 'Connect' and 'Disconnect' buttons. The 'Polling rates' panel has fields for 'Sensor Refreshrate' (5000), 'Loc. Refreshrate' (1000), and 'Graph Refreshrate' (5000). The 'SensorFetch' panel has a radio button for 'SensorTimeOut' (which is selected), a 'SensorFetch rate' field (60000), and a 'TimeOut Time' field (0_ 10:00:00). The 'Control parameter bounds' panel has a table with 'Min:' and 'Max:' columns for 'X', 'Y', 'LocRate', and 'SensorRate'. At the bottom, a status bar shows 'No Connection'.

Controller	
IP	localhost
Port	1900
<input type="button" value="Connect"/> <input type="button" value="Disconnect"/>	

Polling rates	
Sensor Refreshrate	5000
Loc. Refreshrate	1000
Graph Refreshrate	5000

SensorFetch	
<input checked="" type="radio"/> SensorTimeOut	
SensorFetch rate	60000
TimeOut Time	0_ 10:00:00

	Min:	Max:
X:	0.0	1000.0
Y:	0.0	1000.0
LocRate:	100	50000
SensorRate:	1000	60000

No Connection

Localization

- 2 phases:
 - > Ranging + calibration
 - > Algorithms

Localization - Ranging

- $RSS(d) = -P(d_0) - 10 n \log(d / d_0)$
 - > RSS Received Signal Strength[dBm]
 - > $P(d_0)$ Path loss in dBm at a distance of d_0
 - > n Path loss exponent
 - > d Distance between two nodes[m]
 - > $d(0)$ Reference distance[m]: 1m

Localization - calibration

- Configure anchor nodes with dissemination protocol

Localization - calibration

- Confirmation with a status message

Localization - calibration

- Broadcast in order to measure RSSI

Localization - calibration

- Send back RSSI with the collection protocol

Localization – calibration (LS)

- $RSS(d) = -P(d_0) - 10 n \log(d / d_0)$
 - RSS Received Signal Strength[dBm]

$$\begin{array}{c} \begin{bmatrix} RSS1 \\ \vdots \\ RSSi \end{bmatrix} \\ \alpha \end{array} = \begin{array}{c} \begin{bmatrix} -1 & -10 \log \frac{d1}{d0} \\ \vdots & \vdots \\ -1 & -10 \log \frac{di}{d0} \end{bmatrix} \\ \beta \end{array} \times \begin{array}{c} \begin{bmatrix} P(d0) \\ n \end{bmatrix} \\ \Omega \end{array}$$

$$\Omega = (\beta^T \times \beta)^{-1} \times \beta^T \times \alpha$$

Localization - Algorithms

- Trilateration

- Min-Max

- CL

- WCL

Trilateration

- Lateration needs (in theory) distance measurements from:
 - > 3 non-collinear references to compute a 2D position

○ Circle:

$$(x-x_1)^2 + (y-y_1)^2 = r_1^2$$

⋮

⋮

⋮

$$(x-x_k)^2 + (y-y_k)^2 = r_k^2$$

$$2 \times \begin{bmatrix} x_2 - x_1 & y_2 - y_1 \\ \vdots & \vdots \\ \vdots & \vdots \\ x_k - x_1 & y_k - y_1 \end{bmatrix}_{\alpha} \times \begin{bmatrix} x \\ y \end{bmatrix}_{\beta} = \begin{bmatrix} x_2^2 - x_1^2 + y_2^2 - y_1^2 + r_1^2 - r_2^2 \\ \vdots \\ \vdots \\ x_k^2 - x_1^2 + y_k^2 - y_1^2 + r_1^2 - r_k^2 \end{bmatrix}_{\Omega}$$

$$\Omega = \frac{1}{2} (\beta^T \times \beta)^{-1} \times \beta^T \times \alpha$$

Min-Max

- Lateration is computation-heavy; a good simplification models around each anchor node a bounding box and estimates position at the intersection of boxes

Centroid localization

- Coarse grained localization
- calculate the unknown position as the centroid of the anchor nodes within their communication range

Weighted CL

- A weight is coupled to the position of each anchor node by its RSS.

$$Weight = \frac{1}{RSS^g}$$

Localization - methods

- Antenna orientation

- > Onboard - External
- > 20°
- > Outdoor
- > 1 & 5 meter

- Algorithms (outdoor)

Conclusion

- Successfully enhanced the framework and implemented different localization algorithms
- Made a working interface to Scala
- Made a WSN Configuration Tool
- Spent too much time on the framework, too few on the algorithms
